

HOW TO USE THIS STUDY SYSTEM

Final Exam: Wednesday 9/9, 9:00 AM

You have seven documents now, five days out from the exam. This page tells you what each one is actually for and how to sequence them in the time you actually have left -- not a semester-long study plan, a five-day one.

THE LINEUP -- WHAT EACH DOCUMENT IS ACTUALLY FOR

Final Study Guide (55 pp)

Targeted lookup only

Full reference per channel: pathway, functions, indications, highest-yield points, clinical pearls. Use this to look up and confirm, not to read cover to cover -- there isn't time left for a first full pass.

Master Special Points Decoder

Cross-reference, as needed

Organized by POINT CATEGORY, not by channel -- "all 12 Yuan-Source points" in one place instead of scattered across 12 channel pages. Use when a category (Yuan-Source, Luo, Xi-Cleft, etc.) feels shaky across multiple channels at once.

Final Cram Sheet (5 pp)

Daily, especially final 48 hrs

Everything compressed to its densest, fastest-scan form. This is your confirmation document, not a learning one -- read it and notice what does or doesn't come back to you immediately.

Master Quiz Bank & Key

Retrieval practice, daily

Part 1 = the REAL Quiz 1-6 (36 questions, verified against transcripts). Part 2 = 264 additional practice questions I wrote, all 9 weeks. Part 1 tells you exactly what's been tested; Part 2 is volume if you have time left over.

Practice Final, Set 1 & 2

One each, spaced 1-2 days apart

Two full closed-book simulations, no week labels, timed conditions. This is the dress rehearsal -- don't open the answer key until you've finished the whole thing.

Clinical Reasoning Cases (5 cases)

One sitting, mid-week

Relational/extended-abstract prompts -- connecting multiple channels and categories, not simple recall. Use once you're solid on the recall-level material, to stress-test whether you can actually apply it.

THE FIVE-DAY PLAN -- TODAY THROUGH WEDNESDAY

Confirming, not learning -- the material is already covered

Dr. Zhang has said directly that the final reuses the same quizzes you've already taken. That changes what these five days are for: not new learning, but confirming what's solid and triaging what isn't. The plan below assumes you're starting today (Friday) and finishing the night before the 9:00 AM exam.

FRI 9/4

Baseline

Run Practice Final Set 1, full closed-book, timed, no peeking. Score it. Do NOT read explanations yet for anything you got right -- only for misses and guesses. This tells you exactly where to spend the next four days instead of guessing.

SAT 9/5

Targeted repair

Using today's misses as a map, look up each one in the Study Guide and Decoder. Then run Master Quiz Bank Part 1 (the real 36) once, cold.

SUN 9/6

Second checkpoint

Run Practice Final Set 2, same closed-book conditions. Compare its misses to Set 1's -- anything wrong on BOTH is your highest-priority material for the next two days.

MON 9/7

Depth check

Work through the 5 Clinical Reasoning Cases. If your reasoning doesn't match the model answers, that's a sign you know isolated facts but not how they connect -- go back to the specific Study Guide sections involved, not the whole document.

TUE 9/8

Confirm and stop

Full Cram Sheet read-through, plus Quiz Bank Part 1 one last time. Early evening, stop adding new material entirely. Protect sleep over one more read-through -- confirming what you know is worth more than cramming what you don't at this point.

WED 9/9

9:00 AM -- Final Exam

Nothing new the morning of. A light skim of the Cram Sheet over breakfast if it helps you settle in, and that's it.

ONE LAST THING

None of this works as well if the underlying material is wrong -- which is exactly why every document in this system went through repeated verification passes before you got them: coordinates checked against rendered PDFs, answer keys diffed programmatically against source data, factual claims cross-checked against the actual course transcripts. The system is trustworthy because it was checked, not because it was assumed to be fine. Use it the same way you'd want a student to use anything you built: confidently, because you already know it holds up.
